

MBSysC : Error handling

www.robotran.be

February 2019

1 Introduction

This file describes the error handling under C implementation of Robotran, called MBSysC. See the online source files¹ and the Robotran website².

First, the main structure of the error handling is introduced and information about specific modules errors are given. Second, the detailed file containing precisely all the errors in the C code is attached to this document.

This file is for the MBSysC (Robotran) users and assumes a good knowledge of MBSysC documentation³ and Robotran tutorial⁴.

2 General structure

Through all MBSysC code, a three-digits error code shows itself when an error occur, along with messages that are prompted in the command window. **Please read carefully these messages as they contain a lot of information for debugging your code.**

The three digits can help you to quickly know where the error comes from. It is based on three levels (Fig. 1) :

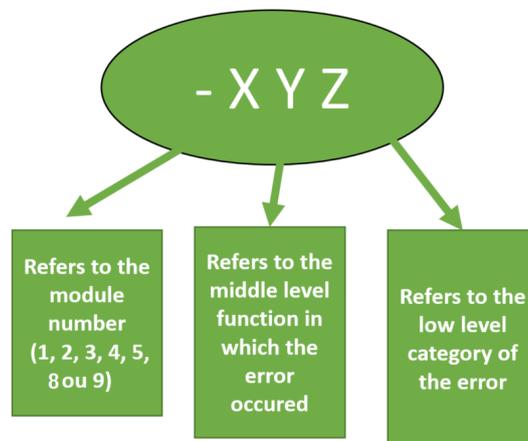

FIGURE 1 – Three digits based error code

-
1. <https://git.immc.ucl.ac.be/robotran/mbsysc>
 2. <http://www.robotran.be/>
 3. <http://www.robotran.be/documentation/MBSysC/html/>
 4. http://robotran-doc.git-page.immc.ucl.ac.be/TutorialModellingFeatures/output_tuto/c-code/

- First, the number **X** of the module is shown :

1	partitionning
2	equilibrium
3	modal
4	dirdyn
5	solvekin
8	Empty Functions
9	loading

- Second, a so-called middle level number **Y** is related to errors in functions that are present in several modules (closing geometry for example).
Numbers from **-X10** to **-X19** are specific for the X module !
- The third number **Z** corresponds to low-level errors linked to basic operations like numerical ones (rank computation for example).

The errors numbers with **X=8** are dedicated to mismatching between the .mbs model file and the provided symbolic files and functions. The high level module (partitionning, equilibrium ...) generating the errors is not traced as this error can (should) be reached by almost all modules. The error goes from number **-801** to **-810**, each number is associated to a missing symbolic function.

Fig. 2 contains the code for the last two levels.

Note that errors containing **-X00** are related to the initialization of a module, probably due to wrong parameters from the user.

Any error ending by **9** (**-XY9**) is related to writing/opening files errors (except for **-X19** and **-809** of course).

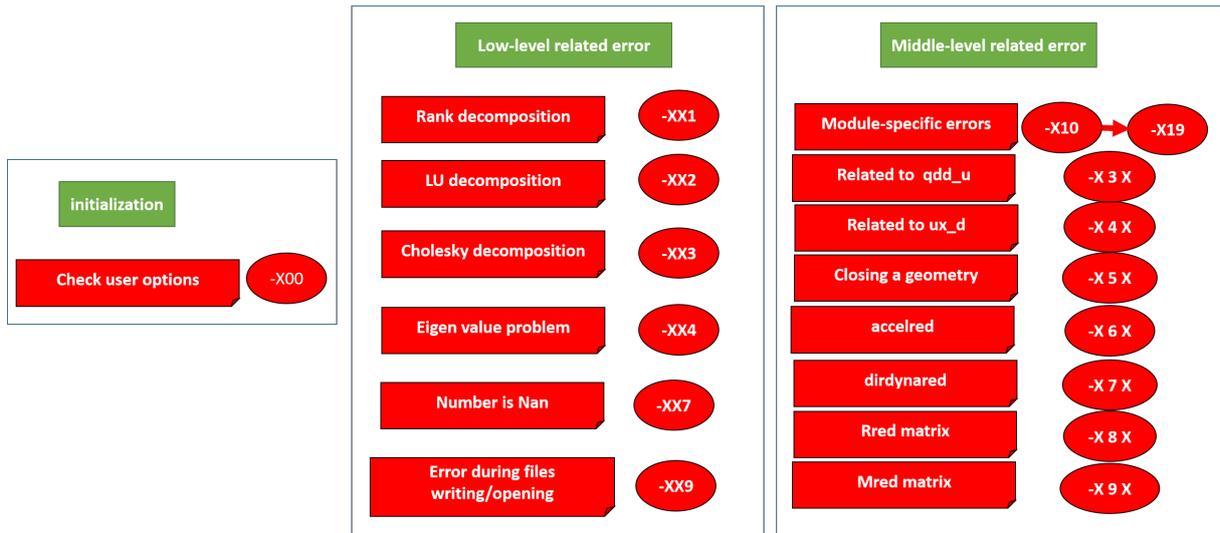

FIGURE 2 – Low and middle levels of error code

Example Error code **-152** : **1** means partitioning module, **5** closing a geometry and **2** problem during a LU decomposition.

3 Detailed errors map

Nexts pages, the document containing the precise map of errors in MBSysC is shown. Be careful, some **updates** may be possible. Any remarks can be given to the Robotran developer team.

Reading and understanding these pages are not mandatory to debug your code.

The messages in the command window should be clear enough to help you debug your code !

Legend

Module

Error message

Intermediate function

Refers to same error message above

Error code :

-XYZ

Refers to the module number (1, 2, 3, 4, 5 ou 9)

Refers to the middle level function in which the error occurred

Refers to the low level category of the error

Initialization

Check user options -X00

Low-level related error

Rank computation -X01

LU decomposition -X02

Cholesky decomposition -X03

Eigen value problem -X04

Number is Nan -X07

Middle-level related error

Module-specific errors -X10 -X19

Related to qdd_u -X 3 X

Related to ux_d -X 4 X

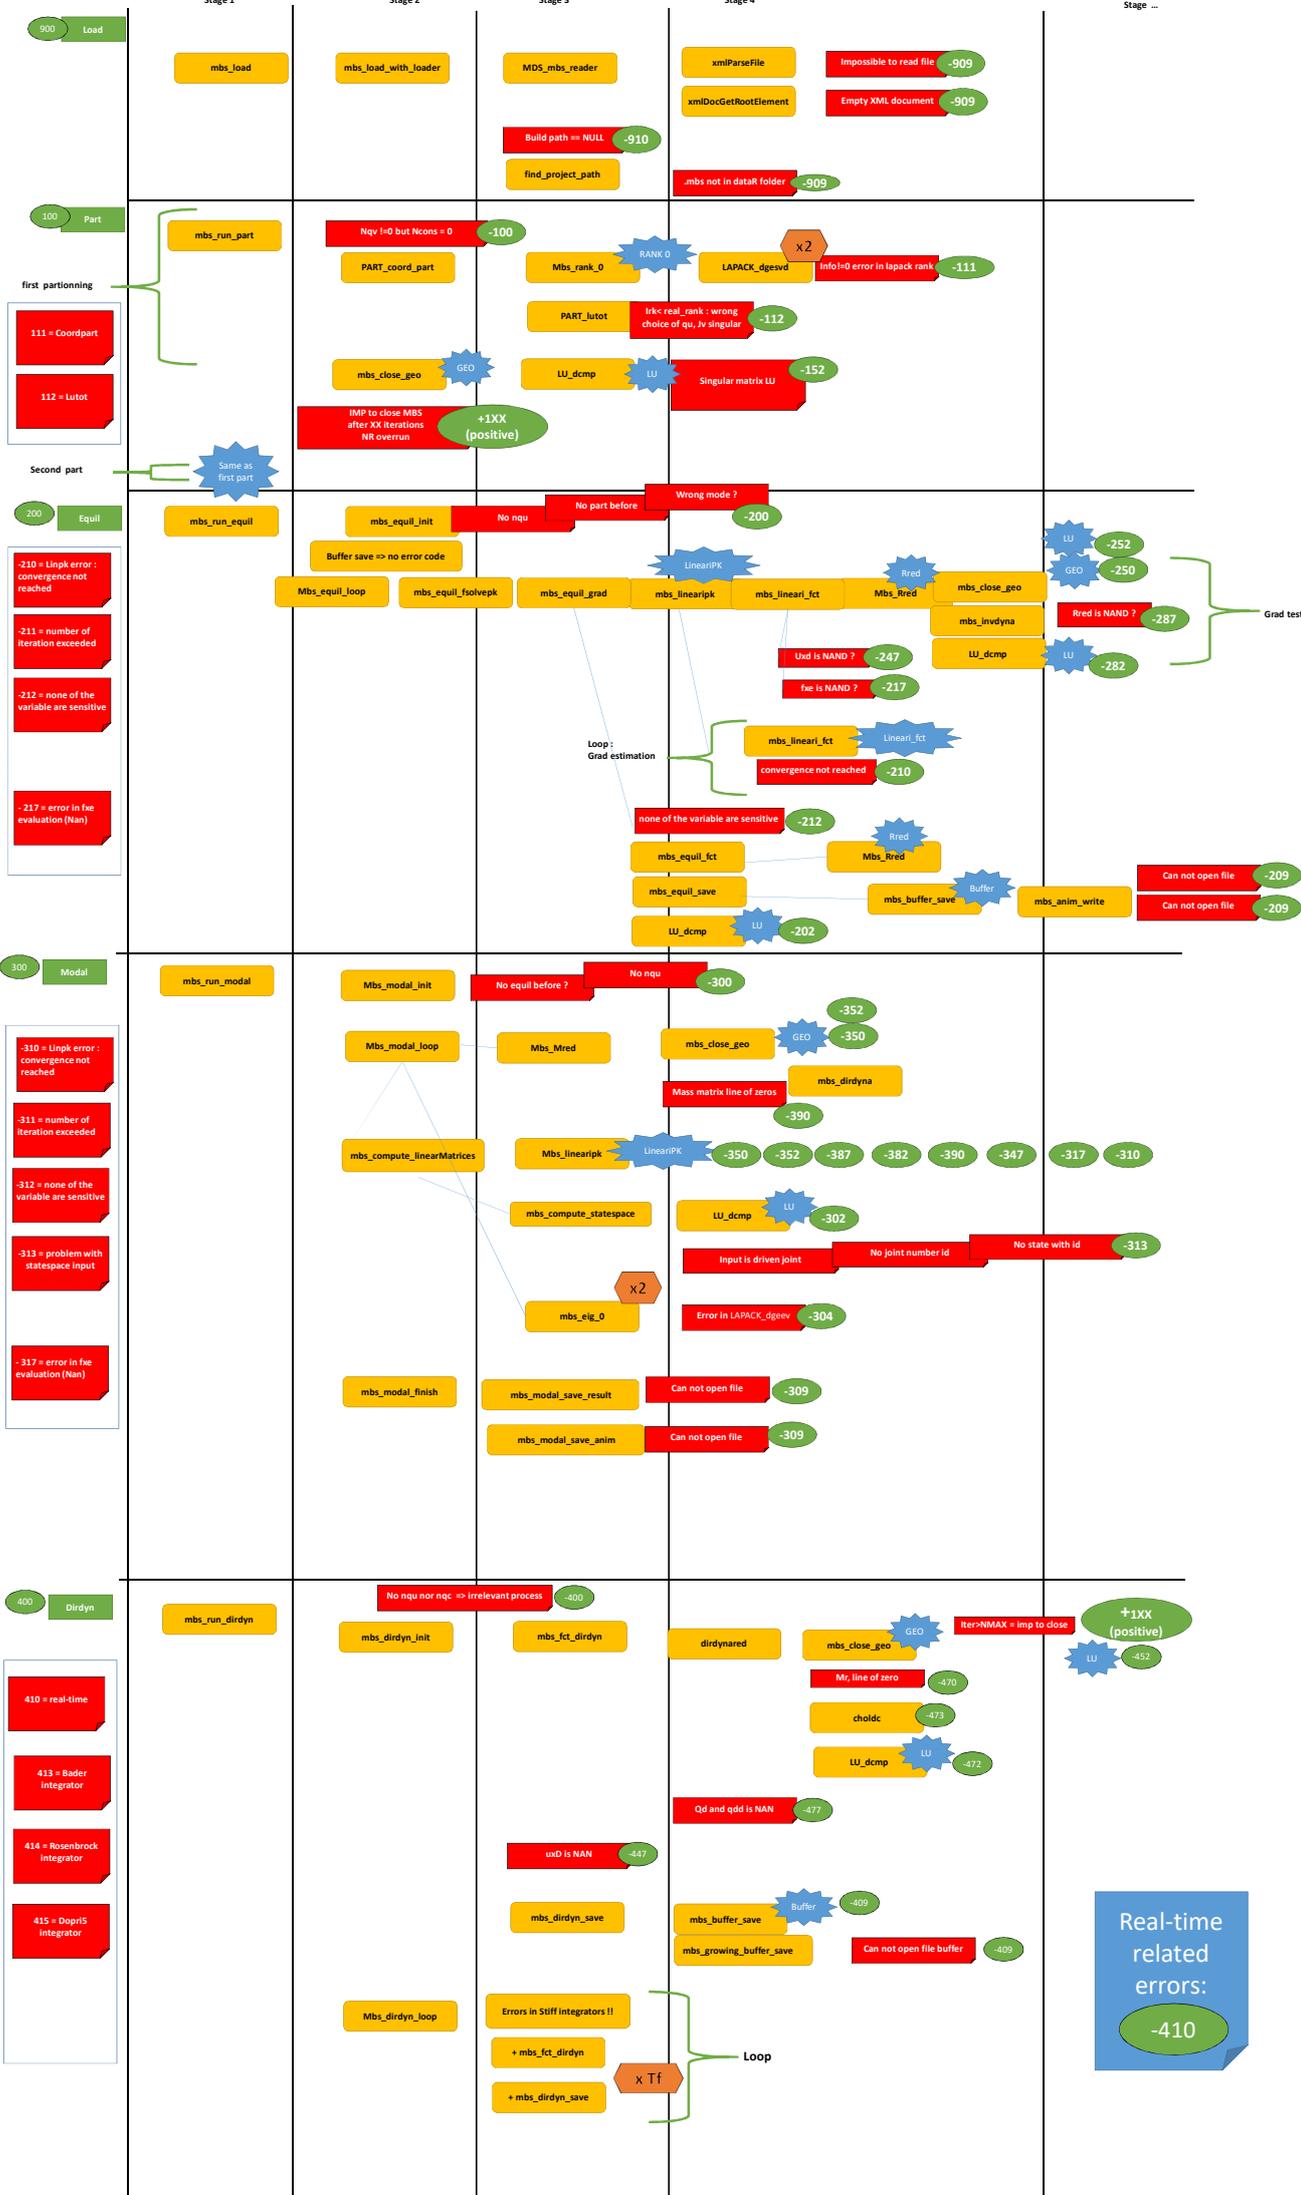

Closing geometry -X 5 X

accelred -X 6 X

dirdynared -X 7 X

Rred matrix -X 8 X

Mred matrix -X 9 X

Real-time related errors: -410
